* Also made of Toncan Iron.

The BERLOY SYMBOL

AR back through the ages of recorded time, men who have known how to do creative work well have been accustomed to sign their handiwork—either with their name or with the mark of their craft.

Damascus swords, Moorish armor, Swiss watches, Dresden china, Venetian glass, Parisian gowns, Irish linen—these are but a few of a multitude of manufactured products that have won world-wide acceptance because men of skill and of integrity of purpose have wished to guarantee the quality and worth of the fruits of their labors by some visible evidence of the maker's identity.

Hence, the needs of symbols or marks that will express both pride of workmanship and public assurance of excellence.

The Berloy symbol—impressed on all Berloy Metal Products—is such a mark. Yet the value of the Berloy symbol is not in the mark itself but in its significance—in the creative skill and the long experience of the Berloy organization, and in the promise of Quality and Service. It is a badge of distinction in industry. It is a pledge of Berloy ideals faithfully observed since their birth forty years ago.

The Berloy symbol, whatever the product it marks, says: "Here is a composition of excellence intelligently produced for the purpose it is to serve by men who know how to do their work well."

THE BERGER MANUFACTURING COMPANY.

Reg. U. S. Pat. Off.

The Factory Behind the Product

Rolling the Sheets

This illustration shows a section of our rolling mills where steel of special analysis for Berloy ceiling sheets is carefully rolled.

The skill with which these sheets are rolled, and the careful heat treatment which follows, are reflected in perfect sheets of uniform smoothness—the foundation of Berloy Steel Ceiling quality.

Nine Hundred Tons Pressure

Every Berloy Ceiling plate is made on a special draw press capable of delivering nine hundred tons pressure. The result is accuracy and sharpness of detail which is impossible with the ordinary drop hammer method. Beads and buttons are pressed absolutely perfect in one operation.

As true as a steel square. Every Berloy Ceiling plate is made with absolute precision. Square, straight and true, they go into place easily and accurately.

Painting the Sheets

The sheets for Berloy Steel Ceilings receive a good coat of a paint developed especially for this work. This paint affords a splendid ground for the finish coats, and as the ceilings are thus painted on both sides, the upper surface has this protection, as well as the exposed surface.

Berloy Steel Ceilings

THE introduction of the first types of steel ceilings attracted keen interest from architects and builders. Their physical advantages over wood-and-plaster ceilings were at once apparent. They possessed serious shortcomings, however. The styles lacked artistic appeal. Crude manufacturing methods were reflected in the quality of the units. The designs showed little appreciation for beauty, correctness and harmony of detail.

Recognizing the stumbling-blocks in the path of the infant industry, The Berger Manufacturing Company set about to remove them. Berger was the first manufacturer to produce steel ceilings in accurate classifications of style and period design.

The introduction of the first Berloy steel ceiling models stimulated public interest to a high pitch and revolutionized the steel ceiling industry. The new models revealed the infinite possibilities of beauty and design in ceilings created from steel. They also suggested a wide range of new applications in the field of interior utility and decoration. Steel ceilings began to compel the consideration of architects and builders.

Faultless reproductions in steel of the beauty of the most pleasing examples of molded plaster, Berloy ceilings have acquired during their years of faithful expression of Berloy ideals a world-wide reputation of leadership.

This leadership has been earned and maintained only by constant devotion to the spirit of typical American progress. The search for improvement in the Berloy product and in the Berloy methods of manufacture has never waned.

The bead and button type of construction originated by Berger was an early development of first importance. A later improvement in this feature enlarged and lengthened the bead to half-oval shape, which gives additional strength and rigidity to the entire plate.

In this type of construction, the beads and buttons are pressed true and perfect in a single operation. They fit with absolute accuracy over underlapping beads and buttons.

The top of the nailing button is depressed, or countersunk, and forms a self-centering and self-guiding nailing point that directs the nail to its correct position. The nailing point also

prevents slipping while the nail is being driven. The erector finds this feature of great advantage in speeding up his work.

Berloy bead and button joints are tight and uniform. It is not necessary that they be calked or tamped—an expensive item in erection costs—in order to assure an efficient job.

Berloy facilities and equipment for the production of steel ceilings are unsurpassed. The finest presses and other mechanical equipment contribute to Berloy excellence. On one occasion, when existing equipment of the industry failed to keep pace with Berloy plans for improvement in the quality of stamping, special presses were designed and installed by Berloy's own experts.

All Berloy ceiling units are produced on special draw-presses, each possessing a 900-ton pressure capacity. These presses give an accuracy, depth and sharpness of detail impossible to achieve with the ordinary drop-hammer method of production. Each unit is an exact facsimile of all other units of the same style and design. Perfection is a Berloy ideal.

Back of the actual mechanical perfection of Berloy steel ceilings—back of the presses and other equipment that reproduce the beauty and character of Berloy designs—are Berloy's own furnaces and rolling mills that aid in making the Berger plant the largest sheet metal works in the world.

Complete control of every manufacturing process from the time the iron ore enters the blast furnace until the finished product speeds on its way to the market is in Berloy hands. Berloy is thus able to assume full responsibility for the perfection of its product.

This control of all steps in production likewise enables Berloy to regulate its output according to market conditions. Aside from serving the interests of economical operation, this is a guaranty that all orders will be promptly filled, either from the main plant at Canton or from the numerous branch warehouses the country over.

Berloy service to buyers of steel ceilings is not an idle claim. Its completeness and efficiency reflect the character of the product itself and help to explain Berloy's position of leadership in the industry.

Instructions for Taking Measurements

WE require but little information, easily obtainable, from which to prepare our drawings; but what we do need must be given accurately, otherwise the ceiling, when shipped, will not fit.

Make a simple outline sketch of the shape of the room, not necessarily to scale, and indicate the measurements from point to point, in figures. Subdivided measurements should always equal the total length or width of room.

Make notation of any spaces not to be covered.

It is very necessary that measurements above the top of window and door casings to the ceiling line be given so that a cornice or molding of proper depth for a desirable finish may be selected.

The windows frequently extend so nearly to the ceiling line in business rooms that only a small cornice, or flat mold, can be used. This information should always be given, and can be indicated as in Figure 2.

Upon application, suggestive drawings and estimates will be prepared and submitted, free of charge, for the approval of the customer.

Kindly indicate preference as to designs or style of ornamentation desired, depth of cornice permissible, and height of ceiling. This will be much appreciated and assist us in the preparation of an artistic arrangement in harmony with your requirements, and of the design most appropriate for the shape of the room.

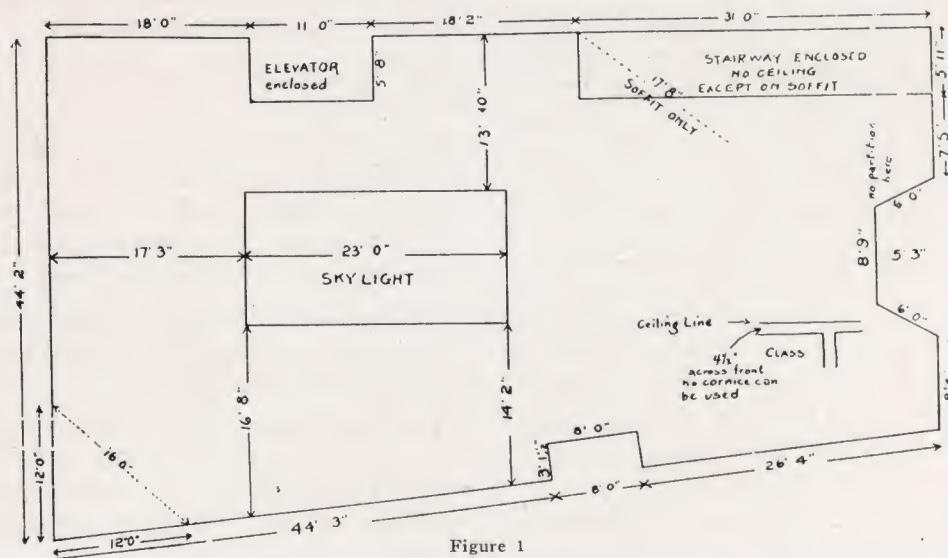

Figure 1

Figure 2

What Our Prices Are Based On

THE prices for ceiling and wall material are for special analysis open hearth steel, painted one good priming coat both sides, including special oval-head nails for the application of the metal only, wood brackets for molding and cornice, properly packed for shipment.

Wood furring strips are never provided for unless specially ordered, then same are charged for extra.

Terms to Responsible Parties

For material only: Thirty days net, or two per cent for cash within ten days from date of invoice.

For work installed: Net cash on completion. Delays will be avoided if purchasers will furnish dependable references at time of placing their order.

To parties not responsible: Order should be accompanied with remittance equal to twenty-five per cent of the value of the purchase, the balance to be subject to our sight draft with bill of lading attached. When this method of payment is desired the purchaser should not fail to state through what bank he desires collection made.

Rules for Estimating Lump Sum Prices

For Ceiling: The area to be charged for is obtained by adding twice the vertical height of cornice from bottom of foot mold to the full length and breadth of room, and multiplying the length and breadth thus obtained together, making no deduction for any skylight, stairway, or for any other opening or obstruction measuring less than 50 square feet.

Example: If the room measures 20 x 60 feet and a cornice of 12-inch depth is used on both sides and ends of room, add 24 inches to both length and breadth, as follows:

Size of room20'0" x 60'0"

Add for 12-inch

Cornice 2'0" x 2'0"

22'0" x 62'0" = 13.64 Squares

To compute approximate lump sum price, multiply the number of squares by the proper list price per square of the design selected, which is published in connection with the various sizes of rooms. Cornice Mitres and Mitre

Leaves are not included in design list prices and must be figured extra at their respective list prices and added to the price of Ceiling material as follows:

13.64 squares at \$9.00 per square....\$122.76

4 only 12-inch Cornice Mitres at

75 cents each 3.00

Total List Price\$125.76

This estimate is based on a plain rectangular room 20 x 60 feet without any exposed beams, or other irregularities, which might change quantity of material and list price of design.

Rooms which are sub-divided by one or more exposed beams will require more material and cornice mitres and take a higher list price per square. Each space or sub-division should be figured as an individual room, using list prices applicable to such size spaces; then add sufficient quantity of material to cover exposed sides and bottoms of beams and figure same at their individual list prices.

For Sidewall and Wainscoting: The area charged for is obtained by multiplying the belt measurement of the room by height from base of foot mold on cornice to baseboard, making no deductions for any openings measuring less than 25 square feet, nor for larger openings more than for whole sheets saved.

In computing this class of work the contractor must make provisions in his price for loss of material from wastage, etc.

Rules for Billing Material Sold at a Discount from List

Ceiling, sidewall, and wainscoting plates, dadoes, borders, and fillers are sold by the square foot.

Cornices and moldings by the lineal foot.

Cornice mitres, mitre leaves, and connections by the piece.

Center pieces and ornaments by the piece when made solid.

Rules for Billing Material Sold at a Net Price per Square

Figure all plates, cornices, moldings, etc., at their actual individual covering area, and stiling or filler at its full width, thus saving the loss in underlapping.

Directions for Applying Berloy Steel Ceiling and Sidewall

BEFORE commencing the application of material, verify all measurements and study carefully working plans.

Working Plans: Proper working plans are supplied, which are prepared from information and measurements furnished. If incorrect information is furnished in the matter of measurements, location of stairways, skylights, or other obstructions, discrepancies will occur, for which we will not be responsible.

Our plans will show in detail the exact location of every piece of material. It is very important that the constructor carefully study the working drawings, and same should be thoroughly understood before commencing the work.

Leveling of Joists: With a straight-edge it can be determined whether furring down or leveling is necessary. This may be accomplished by nailing to the side of joists a strip of necessary thickness, or by setting wedges, as may be required, after ceiling furring strips have been leveled.

It is absolutely essential that furring strips lengthwise and crosswise of the room are centered exactly to the center of nailing points on ceiling plates.

From both ends of the room at points indicated on working plan as "starting line," strike a chalk line; this establishes a starting line from which to work.

For Continuous Ceilings: Use the following rule for placing of wood furring strips; to-wit: Place the first wood strip on starting line, and parallel to the same place additional strips 12 inches on centers for plates of 6 or 12-inch multiple, and for such 24-inch multiple plates which are not sufficiently rigid to carry their own weight without buckling or sagging. For all other 24-inch multiple plates strip 24 inches on centers. Cross-furring or headers must be inserted at the end of each plate whether same be furnished in 2, 4, or 8-foot lengths. This method of furring excels methods formerly practiced, because it provides a solid foundation or backing for all nailing points and requires a less quantity of strips;

also reduces to a minimum the labor required in the application of the materials.

Furring should always be placed at right angle with joists; cross-furring or headers parallel with joists.

Should wood strips be furnished in connection with metal ceilings, the necessary amount required will be based on the above method of construction.

For Panel Ceilings (Sunken Panels): Parallel to the first strip placed on "starting line" through the room, place additional strips according to the width of panels used. Cross-furring strips or headers must be placed at the end of each panel or last multiple thereof. For example, if the panels are in sheets 4 or 8 feet long, cross-furring is necessary at the end of sheet only. Furring strips lengthwise and crosswise the room are to be centered exactly on the center of nailing points in ceiling panels or plates.

Cornices and moldings are to be applied with the use of wood brackets furnished for that purpose, as shown by working drawings; one wood bracket to every 4-foot section of cornice or molding, and extra brackets for mitres and connections. Brackets are used under laps only.

All cornices and moldings should be applied to a chalk line so that the finished work may be absolutely straight and accurate.

Nail the foot of the cornice in position before nailing the top edge, so as to provide for the underlapping of filler if necessary. Stamped mitres for inside and outside corners are furnished for certain coves and cornices, and can be used for right-angle mitres only. Stamped mitre leaves for inside and outside corners are furnished for certain coves and cornices, and may be used for irregular-angle mitres.

For certain coves and cornices both stamped mitres and leaves are furnished. For all other coves and cornices the ceiling constructor will make or cope the necessary mitres as the work proceeds. Working plans always indicate width of border, molding, filler, and projection of cornice, and this will guide the constructor in spacing furring strips to receive same.

Strike a chalk line in center of strip or "starting line" for guidance in placing the plates or panels perfectly straight and true.

Always commence the application of material at rear of room and work forward, when possible.

Steel Sidewalls: The foregoing rules also govern in the application of steel sidewall material, for which furring strips are required when the work is done over plaster or studding; we, however, recommend the use of close sheathing for all continuous plates. When sunken panels are used, furring strips must be used of a size to carry the depth of panel.

If metal wainscoting is used, this should be applied first, then such other material as working plan calls for to make the finish above wainscoting.

Care should be taken to keep the work straight and true.

Sufficient allowance for cutting, underlapping,

and wastage will be provided for. An extra charge will be made for any additional material required on account of incorrect information or measurements.

Wood Furring Strips

Furring strips of $\frac{7}{8} \times \frac{7}{8}$ -inch size are very satisfactory when working over plaster, but experienced ceiling constructors, when working over joists or studding, prefer $\frac{7}{8} \times 1\frac{1}{4}$ -inch size; they are less liable to split, and provide a rigid foundation for the nailing of metal; especially is this true when toe-nailing headers or cross-furring in position.

Wood furring strips are never provided for unless specifically ordered; then same are charged for extra, because users of this class of material can usually purchase, in their own city or vicinity, the necessary furring strips at satisfactory prices and save freight charges.

Wood furring strips of $\frac{7}{8} \times 1\frac{1}{4}$ inches weigh about 18 pounds per 100 lineal feet.

Constructional Drawing of Ceiling and Sidewalls

Suggestions for Room Decoration

THE color scheme of the rooms in which we live or work has an important bearing upon our comfort, happiness and health. The most pleasing and cheerful rooms are always those that have been painted in harmonious and inspiring colors. Many otherwise beautiful metal ceilings fail in their decorative purpose because conflicting colors are used or the color scheme selected is not in harmony with the rest of the room or its furniture or fixtures. The ceiling and sidewalls cannot be treated independently without destroying the harmony of the room.

Choice of Colors

Seeming Effect on Dimensions of Rooms

In selecting a color scheme, it is well to bear in mind that certain colors have a curious effect upon the dimensions of a room. Red walls, for example, make a room look smaller. Blue, yellow, tan, gray and pink seem to increase its size. Green (unless very dark) and brown (unless very light) keep the walls "well in place" and have no apparent effect upon their dimensions.

The Possibilities of Color Combinations

Generally speaking, green is restful and soothing, dark blue depressing, and red stimulating; but when used in judicious combination with certain other colors, quite different effects may be obtained. Blue with green or certain tones of yellow is pleasing, while red walls in a dark room will so absorb the light as to make the room gloomy. Green is warm or cold according to the proportion of blue or yellow of which it is composed. Pure yellow is the most sunshiny color in existence.

If the ceiling is too high to be in good proportion to the size of the room, the ceiling color should be brought down to the bottom of the cornice. This will give a drop ceiling effect and apparently lower the ceiling. On the other hand, if the ceiling is very low the sidewall color should be carried well up onto the cornice and blend into the ceiling color.

Very tasteful and delicate effects may be obtained by combinations of old rose or grayish blues or grayish greens.

Colors with enough black in them to give a

grayish tone make easily blended and harmonious effects.

Tans, greens and browns usually harmonize, as do blues and grays.

Green and red contrast agreeably, while red and orange clash.

Do not attempt the use of a number of colors, as the difficulties of combination increase with the number of colors. Always avoid the bold striping of moldings, cornice or parts of other members; also eliminate, as much as possible, gaudy colors and the use of gold or silver bronze as these have a tendency to detract from the dignified appearance of the ceiling.

Choose Colors According to Location of Rooms

Discrimination should be shown in the choice of colors for rooms in different locations. Grays, blues, greens and soft browns are especially good where there is plenty of sunlight, but grays and blues are too "cold" for rooms with northern exposure. Greens, tans and warm browns are good where there is less sunlight, and yellows and tans are needed to brighten up the sunless north rooms. In other words, the sunny rooms must have colors that soften the glare and warmth, while dark rooms need warm, bright tones.

Finish—Flat or Gloss

The most satisfactory and by far the prettiest finish is the dead or flat finish now so popular. This flat paint or enamel possesses the quality of bringing the lines of "Berloy" Steel ceilings into harmonious relief, giving a beautiful plastic effect, not otherwise obtainable, at a reasonable cost. Flat paint is comparatively new and, in spite of the fact that it is steadily growing in popularity, there are many people who do not understand what it really is.

Good flat paints are regular oil finishes, but do not produce the glossy appearance which gives that "cold" look to a room. They radiate light instead of absorbing it or throwing a harsh glare into your eyes.

All of the leading paint manufacturers make a flat finish paint that is washable with ordinary soap and water, and inasmuch as Berloy Steel ceilings and sidewalls can be washed

without injury to the metal, this soft, velvety finish is the more appropriate. It is really the essential finish to bring out the quiet and luxurious charms of our Period designs in a pleasing and effective manner.

White gloss enamel is appropriate for kitchens, bath rooms or hotels where frequent washing is the rule and a sanitary appearance is required. Appropriate patterns should be selected, which will permit of securing the best results through the use of this gloss finish. Such patterns are the flat designs with shallow panel plates or very simple ornamentation.

How to Paint

Preparation

Before applying any paint make sure that the surface to be treated is in proper condition to receive the coating; that all dirt and grease have been removed; and if any slight openings are noticeable after the first coat of paint has been applied, they should be closed up securely by the painter or decorator, before applying

the second or finishing coat, using cement, plaster of Paris or crack filler for that purpose.

Berloy Steel ceilings and sidewalls are painted by a brush process, receiving one coat of lead and oil paint of a light gray color before shipment. In some instances where dark colors are used they can be finished with one additional coat. However, most ceilings and walls are painted some light shade to give more light and cheerfulness to the room. Two coats are then necessary to give the proper finish. Two or three thin coats of paint are much better than one thick coat.

Paints Not to Use

Do not confuse calcimine or cold water paints with the regular finish flat paints. Cold water paints and calcimine should never be used on metal ceilings as they are undesirable and will not give you satisfactory results. Your ceilings are an important part of your building and if the right kind of paint is used and properly applied, you will have a decorative effect very pleasing and of which you may well be proud.

A Perfect Fire Retardant

An official fire test was made at the Columbia University Fire Testing Station, Greenpoint, Brooklyn, N. Y., November 11, 1914, under the auspices of the fire underwriters, for the purpose of determining the comparative fire-resisting qualities of steel and wood-and-plaster ceilings. Metal ceilings resisted 1,369° Fahr. for 1 hour and 10 minutes (which was as long as the test lasted). Wood-lath-and-plaster ceilings, on the other hand, collapsed in 12 minutes, although exposed to only 849°.

In other words, metal ceilings can be counted upon remaining in place from 5 to 6 times as long as a wood-lath-and-plaster ceiling.

The advantages of Steel ceilings over wood and plaster are obvious. They give perfect protection against fire, water, dust, vermin and rodents, do not crack and collapse and never shrink or warp.

Steel ceilings and sidewalls completely satisfy the demand for a non-combustible, decorative and durable interior finish for all buildings of

the higher type, whether public, churches, theaters, court houses, business blocks, stores, shops, etc., or private residences, garages, etc.

The favor with which Berloy Steel ceilings are regarded in this country and abroad has stimulated us to higher artistic efforts. Architects, builders and owners who desire the most artistic and durable finish for the interiors of their buildings will be sure to appreciate and profit by our endeavors.

The growth and development of the steel ceiling industry prove that the public has been prompt to appreciate and utilize the advantages of ceilings and sidewalls which are ornamental in design, perfect in construction, and combine safety with durability and satisfactory service. Not only does this hold good with new buildings, but the protest of the public is further expressed in the thousands of lath-and-plaster ceilings which are annually being replaced with Berloy Steel ceilings and sidewalls.

Typical Berloy Installations

We have a full series of appropriate patterns and trimmings for all types of buildings in the prevailing style of architecture.

In many instances, the installation of a Berloy Steel ceiling has greatly improved the acoustic properties of churches, halls, auditoriums, etc.

Our designers will gladly furnish submission drawings and estimates to interested parties. Send a complete diagram of the ceiling with accurate measurements, heights of ceiling and distance above doors and windows. Also inform us as to the architectural style of your building.

No. 4516-A
Width, 6½ inches.
Depth, 3¼ inches.
Length, 48 inches.
List, 10c lineal foot.

Colonial Beam Soffit Cover

No. 4085

**Soffit
Finisher
4086**

No. 4086
Width, 9 inches.
List, 12½c each.
Width, 12 inches.
List, 16c each.

No. 4085
Width, 9 inches.
Length, 48 inches.
List, 10c lineal foot.
Width, 12 inches.
Length, 48 inches.
List, 12c lineal foot.

No. 4638—Right

No. 4638—Left

Width, 6 inches; depth, $1\frac{3}{4}$ inches; length,
33 inches; 65c each.

Molding No. 4630
6 x 9 inches; 10c each.

No. 4658

Width, 6 inches; depth, $1\frac{3}{4}$ inches; length,
27 inches; 30c each.

No. 4638-A—Right

No. 4638-A—Left

Width, 6 inches; depth, $1\frac{3}{4}$ inches; length,
27 inches; 60c each.

No. 4639-A—Right

No. 4639-A—Left

Width, 6 inches; depth, $1\frac{3}{4}$ inches; length,
32 inches; 65c each.

No. 4639-B

Width, 6 inches; depth, $1\frac{3}{4}$ inches; length,
26 inches; 60c each.

No. 4639

Width, 6 inches; depth, $1\frac{3}{4}$ inches; length,
38 inches; 75c each.

For above moldings the measurements for lengths are taken on center of mold. For each the radius is $16\frac{1}{2}$ inches to center of mold, excepting No. 4658, which is 51 inches to center of mold. The above special shapes work correctly with Beam Molding No. 4613.

Berloy Steel Lockers

Berloy Steel Lockers have been designed to give an economical and permanently satisfactory installation, and to embody all the quality features of sturdy construction and durability.

They require small floor space—are fire retardant, theft and rodent proof—sanitary and well ventilated. The unit principle of construction gives great flexibility of arrangement, making for utmost economy. They are easily rearranged, added to, or transported to a new building. The smooth working of all mechanical parts continues throughout a lifetime of hard usage.

If you anticipate the purchase of locker equipment, Berloy engineers will be pleased to co-operate with you by submitting plans and specifications for your approval. A number of different arrangements are possible with the wide variety of Berloy types and sizes and you will find our suggestions based upon efficiency, economy and the maximum utilization of available floor space.

Write for Catalog Number 15-D.

Berloy Steel Lockers Recessed in Corridor Walls
Broadway Junior High School, Toledo, Ohio

Berloy Steel Filing Cases

No. 494

Berloy Transfer Units

Economical protection for your seldom-referred-to but nevertheless valuable records. The heavy cold-rolled channel frame permits stacking them to the ceiling, if your floor space is limited. Excellent for use as shop files. Made in letter, cap, bill and ledger size.

No. 694

Berloy Letter Files

A Berloy Steel Filing Cabinet will keep your letters, bills and other valuable papers in a safe and orderly manner. The file shown above will hold 20,000 letters. Drawers operate easily on roller bearing suspensions. Can be fitted with Yale paracentric key lock controlling all drawers simultaneously. Made in all standard sizes.

No. 8560

Berloy Double Door Storage Cabinet

This sturdy steel cabinet is equally useful and pleasing in appearance. It may be supplied with as many or as few shelves as desired. The improved adjustable feature permits them to be easily and quickly moved from one position to another, as storage conditions may require. Doors are equipped with a substantial flat key lock and attractive drop handles.

Size, 36" wide, 18" deep, 78" high.

No. 7053-7064

Berloy Card Index Cases

Berloy Steel Card Cases are made in both one and two drawer units for cards 5 x 3, 6 x 4 and 8 x 5. An inexpensive and accurate way to keep a card record system. Each drawer will accommodate over one thousand cards with the necessary guides. Cases are fitted with attractive brass label holders and pulls. Locks can be applied, if desired, on either single or double drawer cases.

Write for Catalog H, which gives complete information.

Berloy Steel Bins and Shelving

Berloy Shelving in Use by International Harvester Co., Minneapolis, Minn.
This Equipment Was Duplicated in Several of Their Branches

The scientific arrangement of Berloy Bins has solved difficult storage problems in numerous manufacturing plants, railways, retail stores, garages, schools, hotels and many other concerns where efficient storage facilities are desirable.

Combining convenience and flexibility with strength and permanence, Berloy Steel Bins represent the modern equipment for storage requirements in practically any field of industry.

Strength. Formed from steel, punched and tied together with bolts, giving abundant strength and rigidity.

Flexibility. The unit principle of construction provides for ample flexibility in length, width and depth. The 3-inch vertical adjustment of shelves, and horizontal adjustment of dividers, allow for greatest economy in available storage space. This means a space saving of 20% to 25% over wooden bins and shelving.

Safety. Berloy Steel Bins and Shelving are non-combustible and act as a fire retardant.

Indestructibility. Unlike wood, Berloy equipment cannot rot, warp nor split, so there is

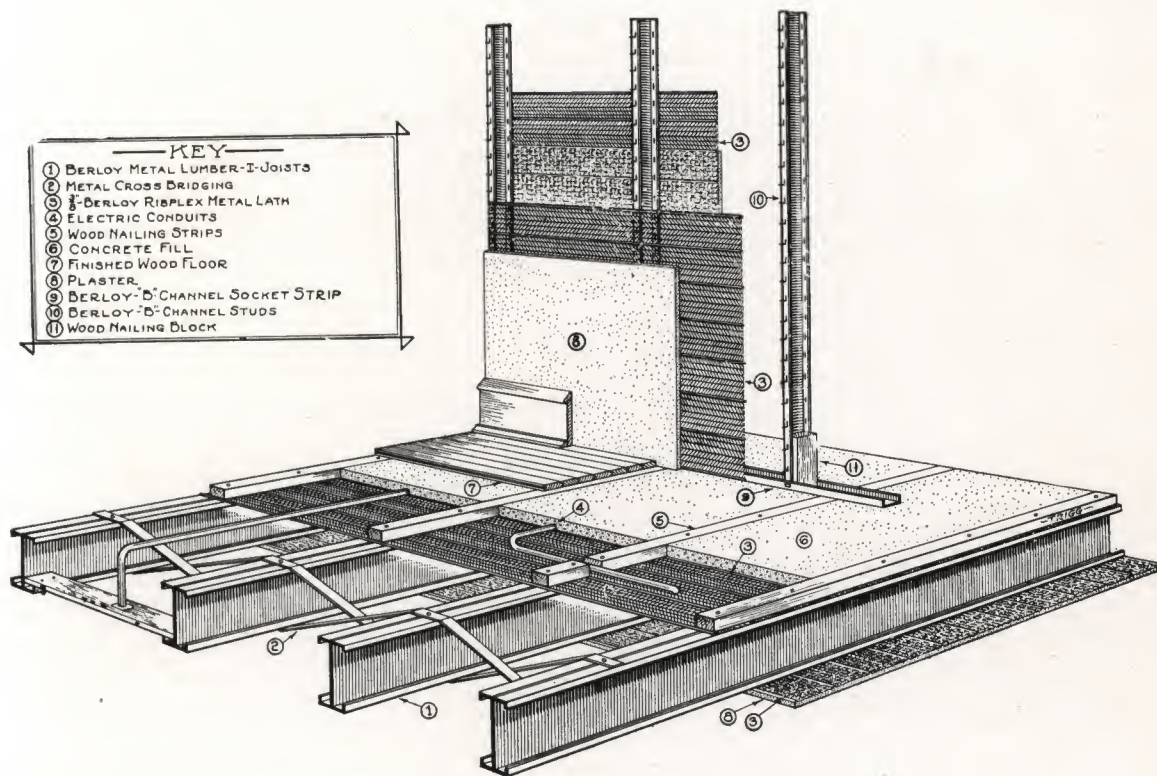

practically no depreciation from these causes or in rearranging.

Simplicity. No clamps are necessary in Berloy construction. Shelves are easily adjustable. The entire equipment can be taken down and reassembled elsewhere without loss of material.

Efficiency. Berloy Equipment creates and maintains high efficiency in the stockroom. It results in a systematic arrangement of stock, making use of every square inch of available storage space.

For additional information, ask for Catalog R.

Berloy Metal Lumber

Economical Fireproof Construction

Standard Metal Lumber Construction consists of Metal Lumber sections of correct size, properly spaced and bridged and with a 2" concrete slab over metal lath on top of joists and with a $\frac{7}{8}$ " cement or gypsum plastered ceiling on the underside of the joists. The fireproofness of this type of construction has been demonstrated not only in authentic fire tests, but in actual fires.

The Metal Lumber type of construction with all fabricating completed under factory supervision removes the uncertainty of field labor and the use of structural materials of varying quality. A speed in erection not attained in any other type of construction is possible regardless of weather conditions, with labor costs proportionately less.

The joists and studs are furnished cut to length, fabricated complete with all necessary connections and accessories. Without special

equipment a small working force can install this type of floor in a minimum amount of time, completing as many floors simultaneously as the preliminary work will permit.

All sections are carefully and accurately proportioned as to size and load carrying capacities within the range of joist and stud requirements.

There is no excess weight or waste of space in the finished structure. With a saving of 40% to 70% in dead weight over other types of fireproof construction, Berloy Metal Lumber effects substantial savings in the footings, foundations, superstructure and all load carrying members. The low cost of transportation, the small unprotected storage space required at the building site, the adaptability, ease, speed of erection, result in savings to the architect, builder and owner that demand careful consideration.
